This task shows you how to setup request timeouts in Envoy using Istio.

Before you begin

 Deploy the Bookinfo sample application including the default destination rules.

• Setup Istio by following the instructions in the

• Initialize the application version routing by running the following command:

```
$ kubectl apply -f @samples/bookinfo/networking/virtual-ser
vice-all-v1.yaml@
```

Request timeouts

Installation guide.

the *timeout* field of the route rule. By default, the request timeout is disabled, but in this task you override the reviews service timeout to 1 second. To

A timeout for HTTP requests can be specified using

see its effect, however, you also introduce an artificial 2 second delay in calls to the ratings service.

1. Route requests to v2 of the reviews service, i.e., a

version that calls the ratings service:

```
apiVersion: networking.istio.io/v1alpha3
kind: VirtualService
metadata:
  name: reviews
spec:
  hosts:

    reviews

  http:
  - route:
    - destination:
        host: reviews
        subset: v2
EOF
```

\$ kubectl apply -f - <<EOF

2. Add a 2 second delay to calls to the ratings service:

```
$ kubectl apply -f - <<EOF
apiVersion: networking.istio.io/v1alpha3
kind: VirtualService
metadata:
  name: ratings
spec:
  hosts:
  - ratings
  http:
  - fault:
      delay:
        percent: 100
        fixedDelay: 2s
    route:
    - destination:
        host: ratings
        subset: v1
E0F
```

http://\$GATEWAY_URL/productpage in your browser.

You should see the Bookinfo application working

3. Open the Bookinfo URL

- normally (with ratings stars displayed), but there is a 2 second delay whenever you refresh the page.
- page.4. Now add a half second request timeout for calls to the reviews service:

```
$ kubectl apply -f - <<EOF
     apiVersion: networking.istio.io/v1alpha3
     kind: VirtualService
     metadata:
       name: reviews
     spec:
       hosts:
       - reviews
       http:
       - route:
         - destination:
             host: reviews
             subset: v2
         timeout: 0.5s
     E0F
5. Refresh the Bookinfo web page.
```

You should now see that it returns in about 1

You should now see that it returns in about 1

second, instead of 2, and the reviews are unavailable.

The reason that the response takes 1 second, even though the timeout is configured at half a second, is because there is a hard-coded retry in the productpage service, so it calls the timing out reviews service twice before returning.

Understanding what happened

for calls to the reviews microservice to half a second. By default the request timeout is disabled. Since the reviews service subsequently calls the ratings service

In this task, you used Istio to set the request timeout

when handling requests, you used Istio to inject a 2 second delay in calls to ratings to cause the reviews service to take longer than half a second to complete and consequently you could see the timeout in action.

You observed that instead of displaying reviews, the

Bookinfo product page (which calls the reviews service to populate the page) displayed the message: Sorry, product reviews are currently unavailable for this book. This was the result of it receiving the timeout error from the reviews service. If you examine the fault injection task, you'll find out that the productpage microservice also has its own application-level timeout (3 seconds) for calls to the reviews microservice. Notice that in this task you used an Istio route rule to set the timeout to half a second. Had you instead set the timeout to something greater than 3 seconds (such as 4 seconds) the timeout would have had no effect since the more restrictive of the

One more thing to note about timeouts in Istio is that in addition to overriding them in route rules, as you

two takes precedence. More details can be found here.

request basis if the application adds an x-envoyupstream-rq-timeout-ms header on outbound requests.

did in this task, they can also be overridden on a per-

In the header, the timeout is specified in milliseconds instead of seconds.

Cleanup

\$ kubectl delete -f @samples/bookinfo/networking/virtual-se
rvice-all-v1.yaml@

Remove the application routing rules:

 If you are not planning to explore any follow-on tasks, see the Bookinfo cleanup instructions to shutdown the application.
